# The Impact of Winning Faceoffs in

Different Zones

In my piece from earlier this week, I tried to calculate what kind of impact a player's on-ice faceoff percentage (FO%) has on his overall even strength Corsi, along with his zone starts (ZS%).   I found that on-ice faceoff percentage has a highly statistically significant impact on a player's Corsi% — about a 0.4% increase in Corsi% for every 1% increase in on-ice faceoff percentage. It's clear that players who play with good faceoff men will have their Corsi% buoyed beyond what you'd normally expect with merely an average faceoff man.
After writing that piece I appeared on Lowetide's show, where he asked about where it's most important to win a faceoff. I think hockey orthodoxy would suggest that it's most important to win faceoffs in either the defensive or offensive zones. "Critical defensive zone faceoff" is kind of a regular term you hear during an NHL broadcast. But during my answer to Lowetide, I recalled a post that Tyler Dellow had done last year showing how important faceoffs are in each zone, and one of his charts on neutral zone play especially stuck with me . I encourage you to read his post, but hopefully Tyler won't mind if I recreate one of his charts here:

This shows that winning a neutral zone faceoff (NZ+) gives your team a massive advantage in Corsi% that lasts beyond 20 seconds of play (it actually gives you a 3 to 1 shot advantage for a dozen seconds of play). The gap between these two lines was much more significant than the gap between the lines for offensive or defensive zone draws.

So on Lowetide's show I was surmising, contrary to popular belief, that a player's neutral zone on-ice faceoff percentage (NFO%) would be much more impactful on overall game play and thus his Corsi% than the other zones. Of course I was just pulling opinions out of my ass, and I wanted to actually test this.

In my last post I also incorrectly stated that ExtraSkater.com was the only place to get on-ice faceoff percentage numbers (but still, thanks for putting it on your site!) — Eric T. let me know that BehindtheNet has included these stats for years and I just hadn't noticed. What's more, BtN actually includes on-ice faceoff wins and losses by zone. This makes it easy to test my curiousities to see if neutral zone draws actually do have an outsized impact on a player's

Corsi%.

My dataset included every player to play at least 41 games in the 2013-14 season, or 568 players in total. I collected each player's 5on5 Corsi%, zone start%, offensive zone on-ice faceoff %, neutral zone on-ice faceoff %, and defensive zone on-ice faceoff %. The results actually astonished me:

SUMMARY OUTPUT

Regression Statistics						
Multiple R	0.627					
R Square	0.394					
Adjusted R Square	0.389					
Standard Error	0.034					
Observations	568					

ANOVA

	df	SS	MS	F	Significance F	
Regression	4	0.420	0.105	91.329	8.13317E-60	
Residual	563	0.648	0.001			
Total	567	1.068				

	Coefficients	Standard Error	t Stat	P-value	Lower 95%	Upper 95%
Intercept	0.12	0.03	4.54	6.82911E-06	0.069	0.173
ZS%	0.34	0.02	17.30	4.48046E-54	0.298	0.375
Neu FO%	0.35	0.04	8.84	1.25597E-17	0.273	0.429
Off FO%	-0.016	0.037	-0.445	0.656	-0.089	0.056
Def FO%	0.081	0.037	2.178	0.030	0.008	0.155

We see that these 4 explanatory variables can explain about 39.4% of the variability in Corsi%. But look at the variables at the bottom. To pass a 95% test of significance, a variable's P-value needs to be under 0.05. Zone starts is the most significant variable, but check out face off percentage by zone.
 Neutral zone faceoffs are just miles and miles more important than end zone

faceoffs. In fact, offensive zone face off percentage isn't even a significant variable, with a P-value of 0.66, way higher than the 0.05 required. Defensive zone faceoffs have a P-value of 0.03, so they seem to be significant, but not nearly of the the same importance as neutral zone faceoffs in impacting a player's Corsi%.

So, let's throw offensive zone faceoffs out of our model to concentrate on the important stuff:

SUMMARY OUTPUT

Regression Statistics	
Multiple R	0.627
R Square	0.393
Adjusted R Square	0.390
Standard Error	0.034
Observations	568

ANOVA

	df	SS	MS	F	Significance F
Regression	3	0.420	0.140	121.879	7.46611E-61
Residual	564	0.648	0.001		
Total	567	1.068			

	Coefficients	Standard Error	t Stat	P-value	Lower 95%	Upper 95%
Intercept	0.12	0.03	4.62	4.81155E-06	0.067	0.167
ZS%	0.34	0.02	17.46	6.87633E-55	0.300	0.375
Neu FO%	0.34	0.04	9.37	1.70147E-19	0.272	0.416
Def FO%	0.078	0.037	2.134	0.033	0.006	0.150

What this model is telling us is that for every 1% increase in a player's neutral zone faceoff percentage, his overall Corsi% is expected to go up 0.34%, while every 1% increase in a player's defensive zone faceoff percentage is expected to increase his Corsi% by 0.08%. It helps to imagine a difference between a

player getting 40% FO% and 60% FO% — if a player's netural zone on-ice FO% increases from 40% to 60%, with everything else remaining constant, I'd expect his Corsi% to increase by 6.8%.

So why is this? Why is orthodoxy totally wrong about the relative importance of end zone vs neutral zone faceoffs? To me, this experiment is one more exhibit of evidence of why controlling neutral zone play has such importance on game play. End zone faceoffs are important simply because of where they are. The team in the offensive end has a temporal advantage in Corsi no matter if they win or lose the faceoff — the heavy lifting was already done for them. If they win the faceoff, they generate a shot, or if they lose the faceoff they have an opportunity to go get it back and generate a shot. Either way, they're in no danger of giving up a shot themselves, as it's impossible.

But this is not so for neutral zone faceoffs. Whichever team wins one of those has the luxury of dictating play for the next 30 seconds or so. They can casually draw back into their own zone to set up a breakout play, or their possession may afford a quick strike into the offensive zone. I would bet that a team losing a neutral zone draw naturally assumes a defensive posture, perhaps giving real estate that a team losing a defensive zone draw simply does not have the luxury of giving up.

To end, I'll include a full list of players included in my experiment ranked by their adjusted Corsi — basically their residual Corsi% after normalizing them for the effects of zone starts and faceoff effects using the 2nd model above. This is what portion of their Corsi% is unexplained after accounting for these variables. Now, there are other very significant factors in adjusting Corsi%,

such as quality of player factors, but for now I just want to show just how influential these 2 pieces of data (ZS% and FO%) working in tandem are

Rank	Name	Team	Pos	ZS%	Neu FO%	Def FO%	Off FO%	Corsi%	PredCF%	AdjCF%

Older: **The Influence of Face-offs and Zone Starts on Corsi**

One of the most important pursuits in advanced hockey stats, in my opinion, is to put our numbers into context. When looking at something like …
